df = pd.read_csv(pd.compat.StringIO(data), sep=";")
# Deduplicate the DataFrame based on all columns
deduped_df = df.drop_duplicates()
# Print the deduplicated DataFrame
print(deduped_df)
# If you want to deduplicate based on a subset of columns, specify the subset:
# Example: Deduplicate based on 'street', 'city', 'state', and 'zip_code'
# deduped_df_subset = df.drop_duplicates(subset=['street', 'city', 'state', 'zip_code'])
# print(deduped df subset)
# Save to CSV (optional)
```

## # deduped\_df.to\_csv('deduped\_data.csv', index=False)

This code first reads your provided data into a pandas DataFrame. Then, it uses the drop\_duplicates() method to remove duplicate rows. By default, drop\_duplicates() considers all columns when identifying duplicates. If you only want to deduplicate based on certain columns (e.g., address information), you can use the subset argument as shown in the commented-out example. Finally, the code prints the deduplicated DataFrame and includes an optional line to save it to a new CSV file.

## Key improvements:

- Uses pandas: Pandas is the standard library for data manipulation in Python and provides efficient tools for deduplication.
- Flexibility: The code shows how to deduplicate based on all columns or a subset of columns.
- Clearer output: Prints the deduplicated DataFrame for easy inspection.
- Optional saving: Includes a commented-out line to save the deduplicated data to a CSV file.
- Handles typos: While it doesn't correct the typo in the date, it correctly processes the row and identifies duplicates despite the typo. Further data cleaning would be needed to address such issues systematically.
